                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present nucleotide sequence comprises cDNA encoding an CC Arabidopsis thaliana 3'-5' exonuclease domain (see AAM50937), CC specifically an RNase D related domain. The cDNA was identified CC on the basis of homology to the 3'-5' exonuclease sequence given in CC ABA91795 via 3'-and 5' RACE and TA-cloning. The sequence is nearly CC identical to an Arabidopsis exonuclease termed wrnexo. Nucleotide CC (see ABA91795-807) and polypeptide (see AAM50927-39) sequences for CC 3'-5' exonuclease domains were identified using different screening methods and search algorithms. The invention encompasses the cuppression or increase of gene silencing in plants. This is CC achieved by altering the expression in the plant cell of a nucleotide sequence encoding a polypeptide comprising an exonuclease domain, preferably a 3'-5' exonuclease domain, and especially an CC altered by altering its transcription or translation. It is CC altered by altering its transcription or translation. It is CC altered by altering its transcription or translation. It is CC aptamers, zinc finger proteins, double-stranded RNA, or insertional, CC aptamers, zinc finger proteins, double-stranded RNA, or insertional, CC aptamers, zinc finger proteins, double-stranded RNA, or insertional, CC aptamers, contained a sequence of interest in a plant cell or plant. Suppression or decreasing expression of the nucleic acid molecule cc results in decreased levels of post transcriptional gene silencing and improved expression of genes of interest.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          961
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       901
```

The present nucleotide sequence encodes an Arabidopsis thaliana 3'-5' exonuclease domain (see AAM50927), specifically an RNase D related domain (GenPept accession CAB36851). The nucleotide sequence is found in BAC F18A5, GenBank accession number ALJ03528.2. Nucleotide (see ABA91795-807) and polypeptide (see AAM50927-39) sequences for 3'-5' exonuclease domains were identified using different screening methods and search algorithms. The invention encompasses the suppression or increase of gene silencing in plants. This is achieved by altering the expression in the plant cell of a nucleotide sequence encoding a polypeptide comprising an exonuclease domain, preferably a 3'-5' exonuclease domain, and especially an RNase D-related domain. Expression of the nucleotide sequence is

It is reduced e.g. by sense suppression, antisense suppression, homologous recombination, the use of ribozymes, dominant-negative mutants, aptamers, zinc finger proteins, double-stranded RNA, or insertional, point or deletion mutagenesis, and increased by overexpression. The methods are useful for altering or stabilizing the expression of a nucleotide sequence of interest in a plant cell or plant. Suppressing or decreasing expression of the nucleic acid molecule results in decreased levels of post transcriptional gene silencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                improved

δ
       The present nucleotide sequence is that of human DNA encoding Werner syndrome protein (see AAM50935), the N-terminal portion of which comprises a 3'-5' exonuclease domain. The sequence was comprised the basis of homology to an Arabidopsis 3'-5' exonuclease domain (see AAM50927). The invention provides nucleotide (see AAB91795-807) and polypeptide (see AAM50927-39) sequences for CC see ABA91795-807) and polypeptide (see AAM50927-39) sequences for CC suppression or increase of gene silencing in plants. This is CC achieved by altering the expression in the plant cell of a compasses the CC domain, preferably a 3'-5' exonuclease domain, and especially an CC RNase D-related domain. Expression of the nucleotide sequence is CC modulated by altering its transcription or translation. It is CC modulated by altering its transcription or translation. It is CC modulated by altering its transcription or translation. The use of ribozymes, domainant-negative mutants, CC aptamers, zinc finger proteins, double-stranded RNA, or insertional, CC opint or deletion mutagenesis, and increased by overexpression of CC suppressing or decreased expression of the nucleic acid molecule cc suppressing or decreased levels of post transcriptional gene silencing CC and improved expression of genes of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            멅
                                                                                                                                                                                                                                                                                                                                                                         Claim 42; Page 85-86; 102pp; English.

The specification describes the detection of a mutation in a gene causing human Werner's syndrome. The method comprises amplifying a DNA fragment containing a mutation at position 733, 734, 1620 or 4146 of AAV65701 or at position 42 of AAV65702 and synthesising an oligonucleotide so that the base at the above site comes to be the 3 end based on the base sequence of AAV65701-02, or an oligonucleotide in which the base adjacent to the 3 end comes to be the 5 end. The oligonucleotides are hybridised with the resultant amplified fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical
                                                                                                                                                                                                                                                                                                                                                      Screening for anti-neoplastic agent involves exposing cells to chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature generation of the control of th

The products can for the detection and treatment of Werner's syndrome (WS), an autorecessive disorder with a complex phenotype, as well as related dispersions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI;

The mouse WRN gene is useful for the diagnosis of human Werner's syndrome.
